INTRODUCTION

- Pancreatic tumor lesions represent a challenging differential diagnosis.
- Abdominal trauma is not an uncommon clinical diagnosis in the emergency room or shock trauma center:
 - * It is one of the most challenging clinical pictures in the world of abdominal surgery & in clinical interdisciplinary management.
 - * The competent surgeon must take care of this entity as part of a cooperating team of specialist representatives with all their experience, due to
 - Unexpected accidents,
 - Case constellations &
 - Individual progressions

GOAL - Question

By means of a scientific "case report", the interesting & rarely described, therefore newsworthy case of a patient with

An unclear tumor mass within the pancreatic head diagnosed by coincidence & suspicious for a serious tumor(-like) lesion, which could be traced back to blunt abdominal trauma

is to be illustrated based on periop./I-interventional management experiences (and) relevant selective references from the literature, which can also be further used for presentation in surgical lectures and as teaching poster.

MEDICAL HISTORY

Current:

- Male patient, 57 years old
 - * Initial diagnosis of prostate cancer in June 2021
 - * Computed tomography (CT) scan of thorax & abdomen for staging → Tumor mass of the pancreatic body of unclear significance
 - * At present, no acute symptom(s)

Own: - Falling down stairs, which caused blunt abdominal trauma & post-traumatic pancreatitis

→ Conservative (non-operative/-interventional) therapy
- University Hospital of Magdeburg (Germany) in 2020

Further diagnoses: * Prostate cancer
* Arterial hypertension
* Chronic nicotine abuse & alcohol consumption

PRESENT STATE

... Male patient – 57 years old

- Good general status & (normosomatic) nutritional status
- Orientated
- Stable cardiopulmonary status - no dyspnea / angina pectoris
- **Abdominal exam:** Soft - no defensive tension - no pressure pain
Real peristalsis across all quadrants
No pain in the kidney bed on either side
No finding at the median laparotomy scar (after open prostatectomy)

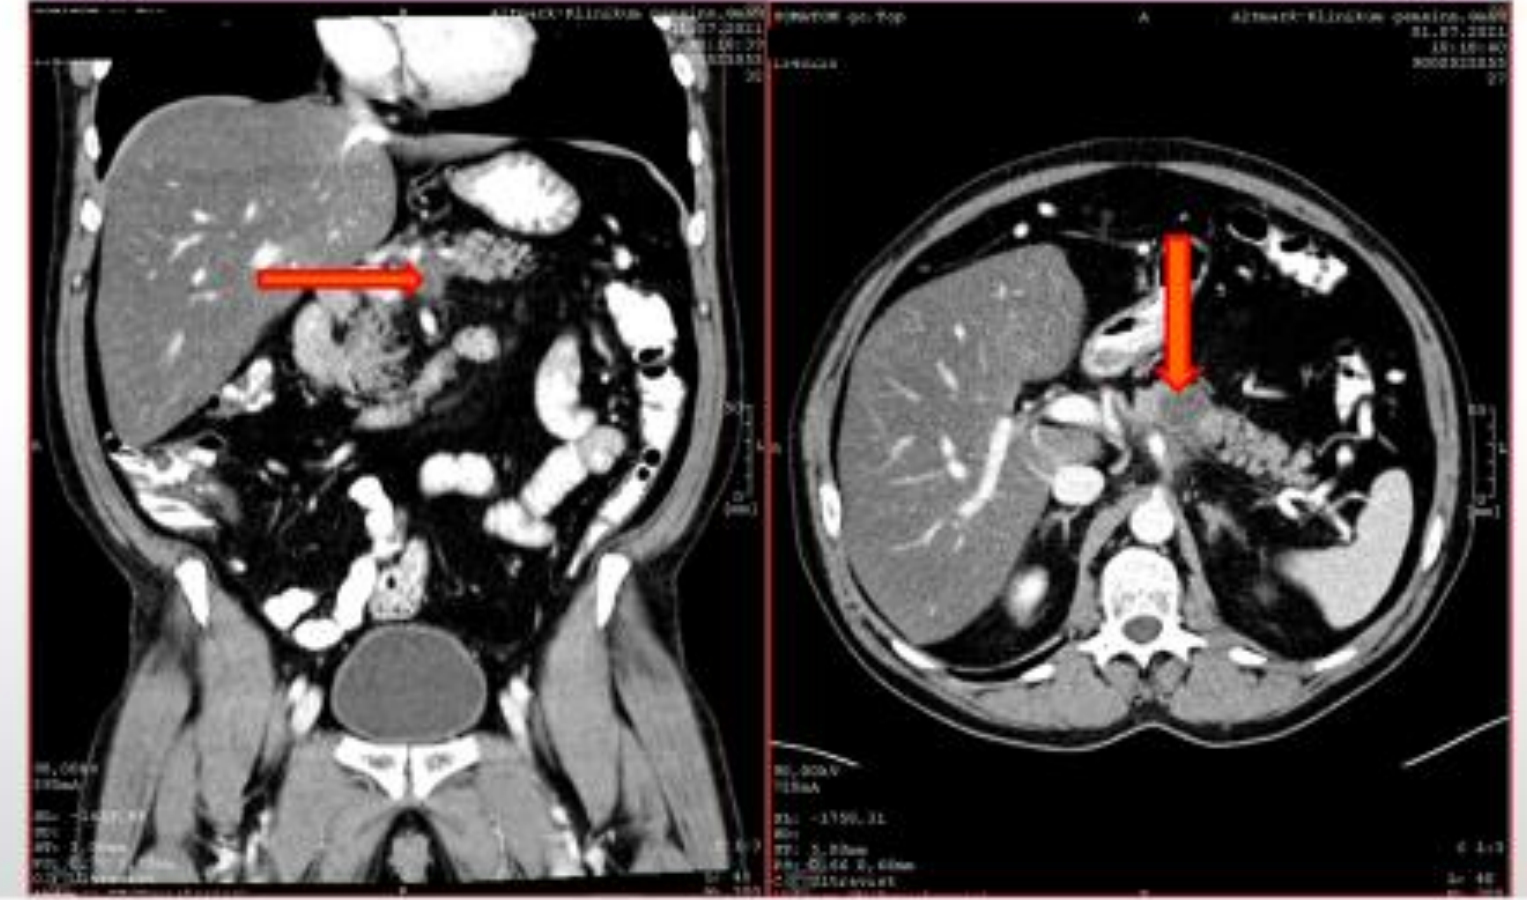

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

DIAGNOSTICS

- Thoracic & abdominal CT scan
- Endoscopic ultrasound (EUS):
 - * (Complementary) Imaging
 - * Puncture for tissue sampling
- Histopathologic investigation of puncture specimen

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

DIAGNOSTICS - Imaging

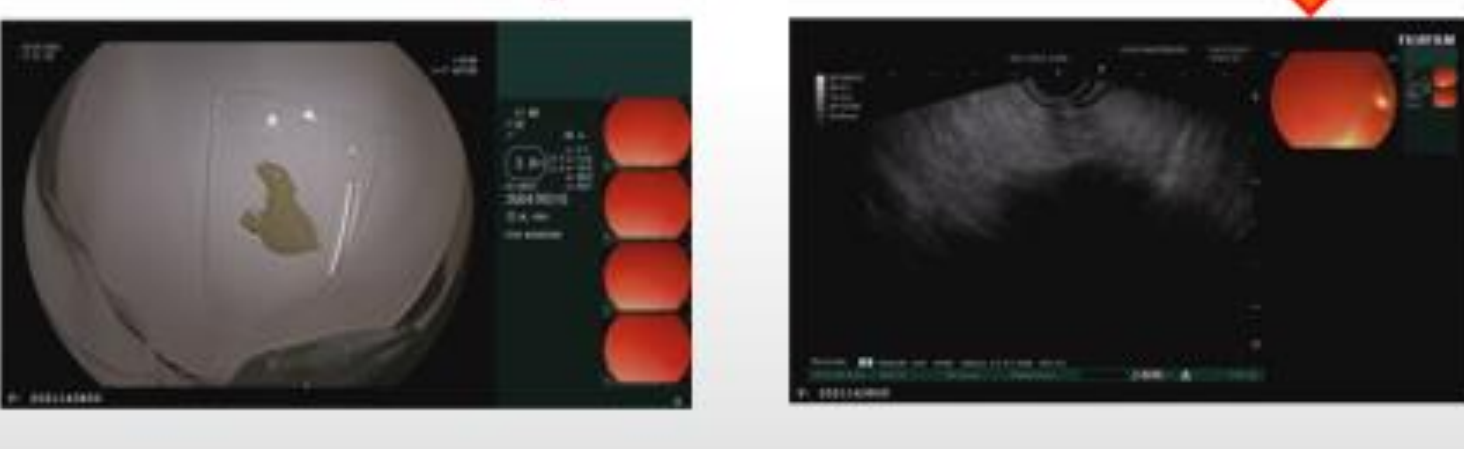

CT scan from 07/01/2021

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

DIAGNOSTICS (II) - Imaging (2)

Pancreas unremarkable - as revealed by CT scan, Semi-liquid edge in the isthmus area, EUS-guided puncture from the (endo-)gastric site (using 19-G needle) → Aspiration of **yellow-grey fluid**

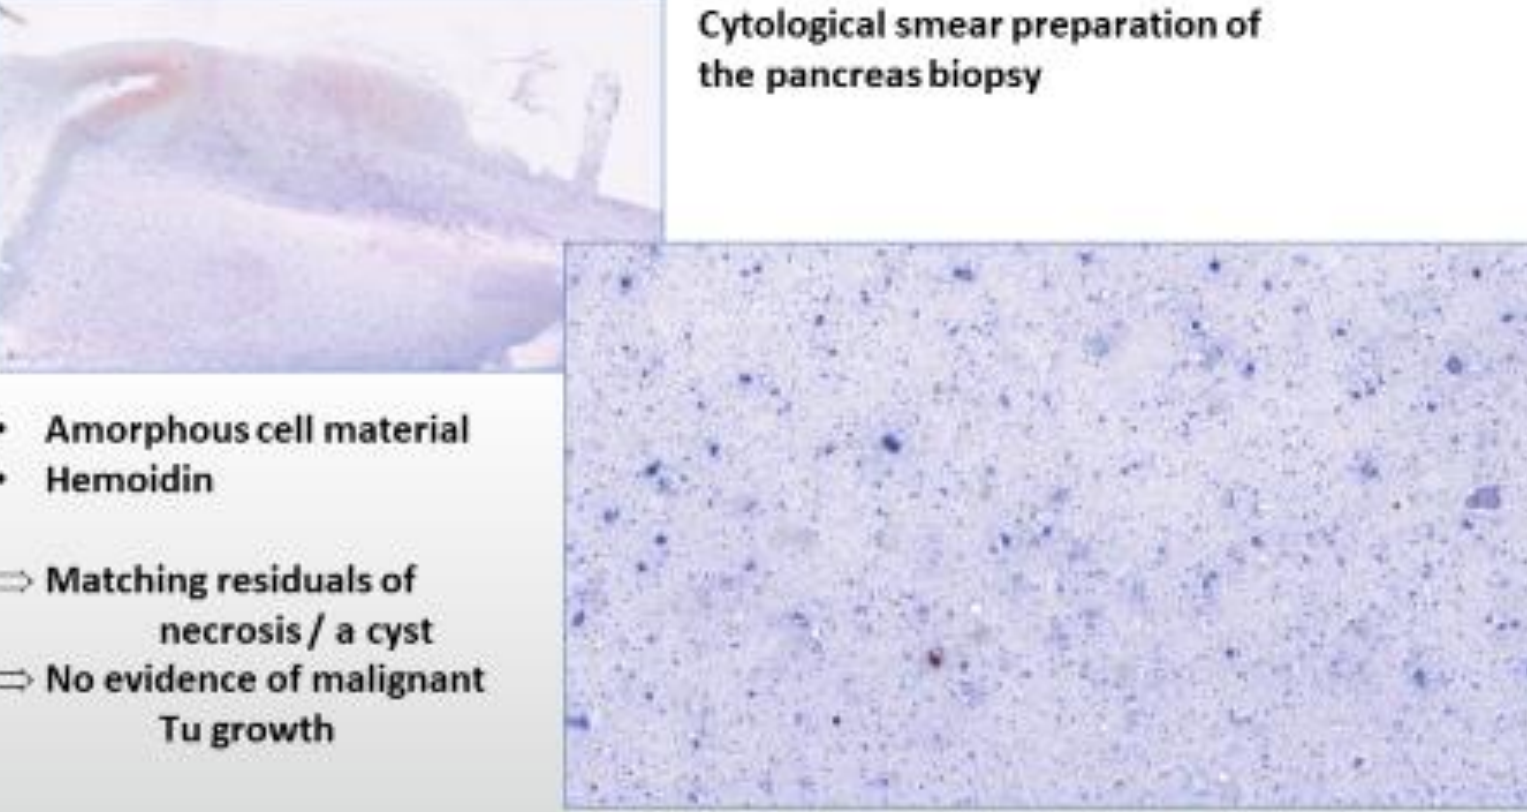

Σ : Old necrosis after posttraumatic pancreatitis

EUS-based imaging & -guided puncture

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

DIAGNOSTICS (III) - Cytology

Cytological smear preparation of the pancreas biopsy

- Amorphous cell material
- Hemoidin

⇒ Matching residuals of necrosis / a cyst
⇒ No evidence of malignant Tu growth

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

WORKING DIAGNOSIS

- including differential diagnoses

- Any mass of the pancreas - until proven otherwise → is suspicious of malignant tumor growth(!)
- Questionable distant metastasis of the prostate cancer
- Independent tumor entity
- Pancreatic (pseudo)cyst
- Intraductal papillary mucinous neoplasm (IPMN)
- Serous cystic neoplasm (SCN)
- Mucinous cystic neoplasm (MCN)
- Solid-pseudopapillary pancreatic tumor ("Frantz tumor")

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

THERAPY

TREATMENT ASPECTS:

- Falling down stairs – in August 2020
- Lab, showing elevated inflammatory parameters → CT scan
 - * **Results:** Serous exudative pancreatitis w/ minor hemorrhagic admixtures
 - * **Therapy:** Conservative (non-operative/-interventional treatment; infusion therapy & antibiotics)

Discharge soon

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

COURSE

CASE DEVELOPMENT ASPECTS:

- New diagnosis of prostate cancer (1st Dx, in June 2021) w/ subsequent CT scan for staging
- **Accidental finding:** Tu mass of the pancreas
- **Presentation in:** - Outpatient clinic of the Dept. of Surgery & Tumor board → → Clarification of dignity
- Blood results, tumor marker
- Ultrasound
- EUS with fine needle puncture

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

COURSE - Finding details

Ultrasound:

Liver: Enlarged (right liver lobe approx. 16 cm in MCL), contours smooth, edges lumpy
Intrahepatic biliary system not expanded, common bile duct w/ normal width

Pancreas: At best only vaguely visible
Does not show the lesion described in the EUS
Duct system not recognizable, no lymph node swelling along the large vessels

ASSESSMENT:

- Steatosis hepatis
- Hepatomegaly
- Pancreas not visible

EUS – 07/19/2021
Pancreas unremarkable, as shown in CT scan - semi-liquid edge in the isthmus area
Puncture – from endogastric site (19-G needle); Aspiration of yellow-grey liquid
ASSESSMENT: Old necrosis of pancreatic parenchyma after trauma, pancreatitis

Tumorboard – 07/22/2021
Histology: No malignant cells
EUS: liquid mass → Follow-up investigation with ultrasound within 3 months
Lab: CA 19-9, < 9 U/mL // CEA, 1,7 ng/mL

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

COURSE - Imaging

CT scan from 12/14/2021

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

DISCUSSION

- Pancreatic trauma

Rarely affected organ due to the deep retroperitoneal location of the pancreas (~ 7% of all abdominal traumas; co-injuries to other abdominal organs are common)

The severity of the injury to the pancreas often determines the course of the disease. Traffic accidents and falls from great heights are often the cause of trauma. The classification is based on the site of the injury within the organ & the severity:

- **Complete transversal rupture:** Parenchyma & pancreatic duct are severed
- **Subcapsular rupture:** Capsule intact w/ ruptured pancreatic duct
- **Pancreatic contusion:** Capsule & parenchyma preserved, hematoma

IMAGING: Ultrasound, EUS, CT scan, MRI/MRCP
THERAPY: Depends on the extent of the findings ranging from drainage insertion & organ suturing to resection - pancreatic resections should be avoided
COMPLICATIONS: Organ dysfunction up to loss, bleeding, infections

Dept. of General, Abd., Vasc. & Transpl. Surg. © DOSOW et MEYER – VIII/2024

CONCLUSION

(„take home message“)

- Any (unclear) PANCREAS(-associated) Tu mass must be clarified.
- A precise medical history of the patient provides information about previous illnesses & also trauma events with long-term consequences, as impressively shown in the case presented.
- In the case of blunt abdominal trauma, injury to the pancreas should also be considered - lipase is part of the relevant laboratory parameter profile both initially and over time.
