Introduction

- ❖ The differential diagnosis of ‘unclear / acute abdomen’ is widespread.
- ❖ In addition to the most common clinical symptoms & diseases, ‘exotic Dx’ are also occasionally of importance.
- ❖ As a result of increasing global migration, rare diseases of certain origins are important differential diagnoses for unclear & recurrent symptoms.
- ❖ The importance of the medical history as an immensely important pillar of clinical practice becomes clear.
- ❖ Even with typical clinical signs of appendicitis may conceal other diseases.

Objective

The following “case report” should put the light on the interesting & rarely described case of a patient with ‘Fam. Mediterranean fever’ as a rare differential diagnosis of “unclear abdomen” in Germany.

- Fam. mediterranean fever - Case report -

© Kanaan et Meyer - IV/2024

CASE DESCRIPTION (1) - medical history

- **Current (present) medical history:**
 - Male patient (19 yrs)
 - Presentation with fever since 2 d
 - Abdominal pain, joint pain & breathing-dependent pulling chest pain
 - Such symptoms - more frequent recently but had disappeared on their own after 2 d
 - Travelling to tropical regions in the last 6 months denied
- **Medical history:**
 - No home medication
 - No previous illnesses
 - Noxas: * Non-smoker
 - * No alcohol consumption

- Fam. mediterranean fever - Case report -

CASE DESCRIPTION (2) - Diagnostics

- **Vital signs:**
AF: 18/min, HR: 100/min, Temp.: 37.5°C
- **Physical examination:**
 - Patient in reduced general condition & normosomic nutritional status
 - Lying in bed with bent legs,
 - Neurological orientation unremarkable,
 - Cardiopulmonarily stable
- **Examination of the abdomen:**
 - Scanty bowel sounds over all 4 quadrants
 - Defensive tension with generalised pressure pain (interpreted as peritoneal irritation),
 - Pain: strongest in the right lower quadrant, McBurney-test (+) // Lanz-test (+) // Psoas sign (-)
 - Complaint of concussion pain
 - Adopts protective posture
- **Laboratory parameters:**
 - * White blood cell count: 8.9; CRP: 35 (SI)
 - * Remaining laboratory (incl. liver & kidney values) → unremarkable
- **Ultrasound:** → no pathological findings

CASE DESCRIPTION (3) - clinical course

- Under intravenous pain medication with Metamizole:
 - Clear improvement - decrease of fever
 - Defense tension persists during abdominal examination
- Continuation of pain medication & laboratory checks
- **Extended family history:**
 - Parents are related
 - A relative in the family with similar symptoms
 - recurrent fever attacks with generalised abdominal pain for 2 years

- Fam. mediterranean fever - Case report -

© Kanaan et Meyer - IV/2024

CASE DESCRIPTION (4) - clinical course after 3 days

- Patient free of fever & symptoms, feels perfectly healthy again & would like to go home
- **Laboratory:**
Inflammation values within the normal range
- What else could be done to obtain the diagnosis?
- **Medical history:**
 - Indications of a familial or genetic component!

FMF

- Search in UpToDate for: ‘abdominal pain & fever’
- If considering the familial component, possible indication of

UpToDate® abdominal pain with fever

Intake > Review > Acute/Chronic/Secondary/UpToDate Pathways

Causes of abdominal pain in adults

...It is characterized by fever, jaundice, and abdominal pain, although this classic triad (known as Charcot triad) occurs in only 50 to 75 percent of cases. The abdominal pain is typically vague and located ...

Lower abdominal pain syndromes

Upper abdominal pain syndromes

Summary

Causes of lower abdominal pain

Relief causes of abdominal pain in women

Causes of acute abdominal pain in children and adolescents

Familial Mediterranean fever - Familial Mediterranean fever is characterized by periodic attacks of fever lasting one to three days and accompanied most commonly by abdominal pain, pleurisy, and arthralgia.

Gastrointestinal infection

Appendicitis

Summary

Causes of acute abdominal pain in children by age

Evaluation of the adult with abdominal pain

...evaluation (eg, fever, jaundice, and right upper quadrant pain) should also be evaluated promptly, often requiring referral to the emergency department for expedited evaluation. Acute abdominal pain: Etiologies ...

Lower abdominal pain

Subsequent steps

Summary and recommendations

Evaluation of acute diarrhea

Familial Mediterranean Fever (FMF)

General information

First described in 1908 (JANEWAY et MOSENTHAL), name by HELLER 1955
other names, e.g., familial recurrent polyserositis

Genetics & etiology

Familial Mediterranean Fever Gene (MEFV) already described in 1997
Autosomal recessive inheritance
Chromosome 16 (gene locus 16p13.3), mutations in all exons, often exon 10 (694 & 680) & then exon 2 (148)

- Hyperactivity of neutrophil granulocytes resulting in spontaneous autoinflammation (inflammasome & IL-1)

Diagnostic criteria according to Tel HASHOMER

Familial Mediterranean Fever (FMF) ... or more simply for clinical practice

Figure 1. Simplified Tel-Hashomer Criteria for the diagnosis of FMF?

Major criteria	Minor criteria
1. Recurrent febrile attacks accompanied by peritonitis, synovitis or pleuritis.	1. Recurrent febrile attacks.
2. Amyloidosis of the AA-type without predisposing disease.	2. Erysipelas-like erythema
3. Favourable response to continuous colchicine treatment.	3. FMF in a first degree relative

Conclusion

Familial Mediterranean Fever (FMF)

- Family & social aspects of medical history are important!
- Consider rarer familial syndromes
- Consider the diagnosis of FMF with origin from the Mediterranean region after exclusion of acute diseases
- Apply Tel-HASHERMO criteria & determine amyloid A in serum (SAA) in acute flare-ups
- Therapy of choice → Colchicine
- Information about complications if therapy is not implemented → Amyloidosis (kidney, heart) can be considered strongest survival-determining factor!
